

# THE MONKEYFX VALVESPORKER v1.8

(or "How I played my part in the war against silence")

## Sag:

starves the circuit of power; at low settings this makes fuzzy sounds, at higher settings it'll gate out unless you play hard. Volume will also drop, so turn it up!

## Mids:

actually a bass cut - thins the sound out which can help cut through, or fills it in for more GRAWR!

## Clip:

reconfigures the clipping circuit; soft clip, like an SD, hard clip like a DS or no diodes for HUGE boost and fuzzy op-amp clipping

## Squeal:

feeds a bit of the output back to the input - at low levels this can accentuate the tone control, at higher levels it'll squeal and with the sag control you can get funny oscillations - even a bit of octave

## Dirt:

just how much filth you like in your sound, plain and simple

## Tone:

bassier to the left, treblier to the right

## Volume:

set your preferred louditude - start low, there's plenty in there
